

Still powering the RaceTech team at Freiberg University of Mining and Technology

Thanks to our long-term sponsor ACTech, we have once again been able to have a casing for our inverter made using precision aluminium casting technology. The company's comprehensive experience in this area enables it to create thin walls that provide a low weight and a high degree of freedom in terms of shape. This means that the casing can be perfectly tailored to our needs and our electronic components are well protected from electromagnetic interference.
